

EARverb 2 - Version history

2.0.1

Improvements:

- LR section : On/Off switch.
- ER section : On/Off switch.
- The VST3 specific "insert bypass" option is now handled.
- A low-level class has been improved to get smoother changes when specific actions are triggered. It should also prevent some artefacts to appear when "waking up" EARverb 2 with a hot signal.
- The displayed pre-delay value now matches the expected (audible) time, considering the late reverb "build up" time.
- More precise fine tune mode (Shift+Mouse) of the pre-delay knob.
- Unless the Enter key is used as a "shortcut" by your DAW, validating a preset (add/rename actions) can be done with the Enter key.

Note: Cockos Reaper seems to use the Enter key on OSX so you may want to activate the "Send all input keyboard to plug-in" option (Reaper->FX panel->Right Click on the name of the plug-in->Check "Send all input keyboard to plug-in").

Fixes:

- Null post-mod depth not updated correctly when loading a project.
- Preset manager not able to add/rename a preset under specific versions of OSX (AU only).

Other:

- Updated manuals.

2.0.0

First public release.
